Date: September 30, 1999

## LINKING TO VIDEO INFORMATION

### Background

This invention relates generally to linking information displayed on a video display to additional information.

5        Hyperlinks (also called anchors or hotspots) are video display locations which a user can select to access a document or a web site (i.e. a collection of documents). Generally, a given document such as a hypertext markup language (HTML) document may have a hyperlink programmed  
10        onto the web page by indicating a given location displayed on the web page. When the user operates a pointing device on the designated embedded linking area, additional information may be accessed. Conventionally the embedded linked area is accessed by highlighting the linked area and  
15        operating a mouse button while a cursor or highlighting is arranged to point to the hyperlinked site.

      The additional information may be additional video information, textual information, a web page or any of a variety of other information. A uniform resource locator  
20        (URL) is used to access the additional information. Absolute URLs locate external sites and relative URLs point to locations on the same web site or document.

Of course, the hyperlink works because the web page is programmed to include the embedded pointer. Thus, the hyperlinks become part of the code which defines the web page. The hyperlinks can be URLs or images which have associated URLs.

Because the hyperlinks are hard coded into the web page, once the hyperlinks are defined, it is relatively difficult to change them. Thus, if a given hyperlink points to a given source such as a web page, it generally will always point to that source unless the HTML code is rewritten.

In a number of circumstances, it would be desirable to enable the linking software to be redefined over time. Thus, at one time interval, when a user selects (or mouse clicks on) a given icon on a web page, one thing would happen and at another time a different thing would happen. This would allow greater flexibility and enables the web page creator to link to different sites at different times. For example the web page owner may sell the hyperlinks to different users at different times.

In conventional magnetic or optical media such as hard disks, magnetic tape, compact disks, digital video disks (DVD), and floppy disks, hyperlinking is generally not utilized. However, it would be desirable to enable reprogrammable hyperlinks from a variety of media including media storing video presentations such as movies.

Thus, there is a continuing need for better ways to link video information to other information in a way which may be readily reprogrammed and which is sufficiently flexible to enable additional information to be linked to  
5 information in a video presentation at various times.

### Summary

In accordance with one aspect, a method of linking information to video information includes linking the video information with other information based on the location of  
10 the video information on a frame and a frame identifier. The other information may be accessed in response to a user selection of a frame location.

Other aspects are set forth in the accompanying detailed description and claims.

### Brief Description of the Drawings

Fig. 1 is a front elevational view of one embodiment of the present invention;

Fig. 2 is a schematic depiction of one implementation of the present invention;

20 Fig. 3 is a schematic depiction of another embodiment of the present invention;

Fig. 4 is a depiction of how a frame may be broken up into distinct locations with embedded links which may be reprogrammed in accordance with one embodiment of the  
25 present invention;

Fig. 5 is a flow chart showing software for implementing one embodiment of the present invention in connection with a client;

Fig. 6 is a flow chart showing software for implementing one embodiment of the present invention in accordance with a server; and

Fig. 7 is a block diagram showing a client in accordance with one embodiment of the present invention.

#### Detailed Description

10 A computer system 10 may include a processor-based unit 12 coupled to a display 14 such as a conventional television receiver having a display screen 22. A remote control unit (RCU) 16 may be utilized to remotely control the unit 12 and the display 14. Thus, in accordance with  
15 one embodiment of the present invention, mouse style commands may be produced by operating the directional buttons 26 to move a cursor image or highlighting on the display screen 22 to implement a conventional pointing function.

20 The RCU 16 may be an airwave transceiver 24 which communicates with transceivers 18 on the units 12 and 20. In this way, airwave communications may be undertaken between the components. The user can then control each component by providing input commands through the cursor  
25 controls 26, the pushbuttons 28 or the keypad 30.

While the present invention has been illustrated in connection with a processor-based unit 12 which may be called a set top computer system, the present invention is applicable to any of a variety of processor-based systems including desktop computers, laptop computers, and processor-based appliances, as additional examples.

The RCU 16 may conveniently generate and receive airwave signals such as infrared, radiowave or ultrasonic signals. While the present invention is illustrated in connection with a processor-based system 10 which uses an RCU 14 as a pointing device, the present invention is equally applicable to processor-based systems which are controlled using other pointing devices including a mouse, a rollerball, or a touchpad, as additional examples.

In accordance with one embodiment of the present invention, the system 10 may be one of a plurality of similar receivers 10, shown in Fig. 2, which receive video transmissions (indicated by the arrow 35a) from a server 34. Each receiver 10 may communicate through a back channel 35b, in accordance with one embodiment of the present invention, with the server 34. Thus, as illustrated, two-way communications may be implemented between the server 34 and each of the plurality of receivers 10.

The server 34 may receive video content such as television programming from a content provider 32. The

server 34 may also send communications to the content provider 32. In addition, the server 34 may communicate in a two-way communication protocol with a link library 75 in accordance with one embodiment of the present invention.

5 In one example of an implementation of the present invention, television programming may be transmitted from the server 34 to each of a plurality of receivers 10. At each receiver 10, a pointing device may be utilized to select a particular location in a particular video frame in  
10 order to access additional information. The selection may be transmitted over the back channel 35b from a receiver 10 to a server 34. In response, the server 34 may access the link library 75 to provide additional information corresponding to the particular location and the particular  
15 frame selected by the user of a receiver 10. That information may then be transmitted, for example as indicated by the arrow 35a, from the server to the receiver 10. Alternatively, the additional information may be obtained from the content provider 32.

20 A variety of transport media may be utilized to convey the additional information. For example, telephone, cable, satellite, and networked connections, including Internet connections, may be utilized to implement the transport media.

25 While the embodiment illustrated in Fig. 2 involves a video transmission system such as a television broadcasting

system, the present invention is in no way limited to broadcast applications. It may likewise be applicable to any of a variety of transmissions involving visual information including video transmissions, movie distribution systems, or Internet web pages, as additional examples.

In accordance with still another embodiment of the present invention, a medium 70 may be provided which contains video information. The medium 70 may be, as examples, a floppy disk, a hard disk, a compact disk, a digital video disk, or any of a variety of optical or magnetic media. The medium 70 may store one or more video images which may be displayed on a conventional processor-based system. The processor-based system may also include a system memory 72 which may store a variety of programs which may be executed on the processor-based system.

When the user selects a given location and frame of an image currently being displayed on the system, the system memory 72 may record the selected location and its frame. The memory 72 may access associated information, which is stored on the medium 70, to display additional information, in accordance with one embodiment of the present invention. The nature of additional information is essentially boundless and is defined only as information which is linked by design to a given location in a given frame in the content originally stored on the medium 70.

5 In the embodiments illustrated in Figs. 2 and 3, video data may define a video frame or a plurality of video frames. Each video frame may be identified (if more than one video frame is involved) by a frame identifier. The frame identifier identifies each frame of a plurality of video frames which, for example, may make up a video presentation such as a movie, a television program, or a web site as examples. In addition, a plurality of locations on a given frame may be identified relative to other frames. Thus, when the user selects a given location and a given frame, that location and the identified frame itself provide an indication of the focus of a given user. The given location on a given frame may be linked through the active media (or through other media) with additional information which may be associated with the selected location.

20 One convenient frame identifier is the time code in accordance with one of a variety of industry standards including the Society of Motion Picture and Television Engineers (SMPTE). Conventionally, the time codes are utilized to enable synchronization between audio and video tracks. The SMPTE time code synchronization system is a biphase mark longitudinal time code (LTC) which can be recorded onto the audio track of a video tape in one example.

Another time code is the vertical interval time code (VITC). The VITC may be advantageous in some applications because it can be read even when the medium storing the video is paused.

5       The SMPTE time code is a broadcast standard time which may be recorded in the format HH:MM:SS;FF, where FF is a frame number between 00 and 29, HH is a two-digit code for hours, MM is a two-digit code for minutes and SS is a two-digit code for seconds. Assuming a frame rate of 30 frames  
10       per second, the SMPTE time code may identify every frame of a video sequence such as a movie, a television program or other video information.

15       While the present invention, in one embodiment, uses a time code to identify a given frame, the present invention is in no way limited to the use of time codes. The time code is simply a convenient way to identify one of a plurality of frames. Any other technique may also be utilized to identify each of the frames including simply providing each frame with a sequential identifier.

20       A frame 36, illustrated in Fig. 4, may be overlaid by a grid system having an X screen direction 40, a Y screen direction 42 and a frame identifier 38. The frame identifier provides the hours, minutes and seconds indication followed by a 00 to 29 frame number indication.  
25       In the embodiment illustrated in Fig. 4, the X and Y screen directions provide rectangular coordinates to identify a

plurality of grid segments such as the segments 44 and 46. In this way, every image defined on the frame 36 may be identified by one or more grid coordinates in the X screen and Y screen directions.

5           Thus, as illustrated in Fig. 4, a given frame 36 may have two embedded links, for example a link 1 and a link 2 associated with the locations 44 and 46. If these locations are selected by the user, they automatically link to additional information which may be stored, for example,  
10           on the medium 70 in the embodiment of Fig. 3 or to the link library 75 or content provider 32 via the server 34 in the embodiment of Fig. 2.

          While Fig. 4 illustrates an embodiment in which a rectangular grid work is utilized to define locations, any  
15           of a variety of location identifying techniques may be utilized. For example, polar coordinates may be utilized, a patchwork of regions may be identified by location numbers, and any of a variety of other indication  
20           identifying techniques may be used as well. As another example, one or more display pixels may be associated as a link to additional information.

          The user may select a location 44 or 46 using a conventional pointing device such as the RCU 16. When a  
25           particular item on the display has a cursor image associated with it, in one embodiment of the present invention, and a mouse button is operated (such as the

button associated with the controls 26), that particular location is selected. In response to the selection of a particular location, additional information may be identified. That is, given the particular location in a particular frame, the processor-based system may search for information linked to that particular location in that particular frame.

Thus, in one embodiment of the present invention, the content provider may know that a given location in a given frame is a particular product. When the user selects that location, the user may be provided with additional information, such as video information, about the particular product.

Because of the location system described herein, the linked information may be added or changed at any time. For example, as users continue to select a given location on a given frame, the content provider or other entity may choose to provide additional information in response to repeated requests.

Similarly, the information which is provided may be changed at any time. Because the linked information is not hard coded into the media, the information may be changed in response to the desire to update information, to change sponsorships, or to improve the quality of the information, as examples.

Thus, by providing a system of location identifiers, the need for hard coding of hyperlinks may be avoided. This allows a dynamic system in which the linked information may be varied over time to meet changing needs.

5 In addition, it enables essentially every item in a given video display to be selectively linked to additional information. Moreover, there is no need to adjust the programming of a particular page such as Internet web page, but instead, the desired item can be identified by  
10 location.

In the embodiment indicated in Fig. 2, the user selected locations together with the frame identifier may be transmitted back to the server 34 over the back channel 35b to the server. The server 34 may then be responsible  
15 for obtaining the linked information for example from the link library 75 or the content provider 32. In this case, the receiver goes outside its own system to obtain the additional information through the link.

In contrast, in the embodiment illustrated in Fig. 3,  
20 the linked information may be contained elsewhere on the same media 70 that originally stored the video data. In this case, the additional information may be found entirely within a single processor-based system.

The software 48, resident on the receiver 10, may  
25 begin by receiving the video data as indicated in block 50 as shown in Fig. 5. The link may be established between

that data and the time code system that is utilized by the particular receiver. For example, if the user uses the SMPTE time code system to identify selected locations on selected frames, synchronism of that system is established (block 52).

Next the system awaits a user selection as indicated in diamond 54. The user selection may correspond to the use of a pointing device, such as the RCU 16, to select a particular location on a particular frame. Once the user makes the selection, the location identifiers are stored as indicated in block 56. The location identifiers may identify a particular location in the frame as well as a particular frame. One such identifier is the SMPTE time code.

In some receivers 10, a recording system may be provided wherein data is continuously stored onto a magnetic or optical storage media such as a hard disk drive. When the user wishes to access additional information for viewing, the ongoing video stream may be stored. In systems which use a recording media of the type described, this may be accomplished by pausing the active display, continuing to record the received video, such as a television program, in the background, while displaying additional information selected for access by the user through the linking system described above.

Thus, in these systems, sometimes called broadcast  
pause and resume systems, with this type of recording  
media, the pause function may be automatically activated in  
response to a user selection of a given location on a  
5 particular frame. The pause remains in effect until such  
time as the user has finished viewing the additional  
information and indicates a desire to return to the ongoing  
video program. Thus, if the pause is active, as determined  
in diamond 58, the pause may be automatically instituted  
10 for the duration of the excursion into the additional  
information as indicated in block 60.

Thereafter, the location identifiers are transmitted  
through a source of video information associated with the  
link (block 62). Thus, in the embodiment shown in Fig. 2,  
15 the location identifiers may be sent outside of the  
processor-based system 10. In contrast, in the system  
shown in Fig. 3, the information may be accessed internally  
of the processor-based system.

The location identifier for the content may be  
20 accessed such as a URL or other identifier as indicated in  
block 64. When the user selects the content as indicated  
in diamond 66, content may be automatically displayed as  
indicated in block 68. Again, when the user indicates an  
intent to resume the original video material returning from  
25 the linked information, in systems which use a on-going  
recording of a received video stream, the system may

automatically transition back to display the recorded media (block 70). The system may accelerate through the replay of the recorded media to attempt to return to real time display of the just received video information, as indicated in block 70.

Turning next to Fig. 6, software 74 which may be resident on the server 34, may begin by transmitting video data to one or more receivers as indicated in block 76. Synchronization is established with the receivers as indicated in block 78. When a request for a location identifier is received, as indicated in diamond 80, the requested links may automatically be located as indicated in block 82. Thus, in the embodiment illustrated in Fig. 4, the coordinates of the particular selected location and its frame may be compared to a database containing links for a variety of locations on a variety of frames. When a link is accessed, it can be returned to the receiver. The return link may be a URL or other script that directs the receiver to the source of the information, or the information itself may be provided directly from the server to the receiver as indicated in block 84.

In one embodiment of the invention, the user may cause indicia, such as highlighting, to appear at those locations that are linked to other information. This feature may be activated, for example, during a software set-up sequence.

Finally, referring to Fig. 7, the receiver 10 may include a processor 150 coupled to an accelerated graphics port chipset 152 (see the Accelerated Graphics Port Interface Specification, Revision 1.0, dated July 31, 1996 available from Intel Corporation, Santa Clara, California). The chipset 152 may be coupled to system memory 158 and an AGP port 154. The port 154 communicates with a graphics accelerator 156 and a television receiver 14 in one embodiment of the present invention.

A bus 160, coupled to the chipset 152, also couples a TV tuner/capture card 162 coupled to an appropriate antenna or other transport medium access port 164. A bus 160 also couples a bridge or interface 166 which may communicate with a hard disk drive 168. The software 48 described previously may be stored on the hard disk drive 168. In a broadcast pause and resume system the hard disk drive 168 may be buffered so that it may essentially simultaneously record and playback information in an interleaved or multiplexed series of store and playback sequences.

A second bus 170 may be coupled between the bridge 166 and a serial input/output device (SIO) 172 and a basic input/output system (BIOS) 174. The SIO 172 may communicate with an infrared transceiver 18 which is part of the processor-based unit 12. The transceiver 18 communicates with a transceiver 24 on the RCU 16. The RCU

16 also includes a controller 150a coupled to a memory 158a and the keypad elements 26, 28 and 30.

While the present invention has been described with respect to a limited number of embodiments, those skilled  
5 in the art will appreciate numerous modifications and variations therefrom. It is intended that the appended claims cover all such modifications and variations as fall within the true spirit and scope of this present invention.

What is claimed is:

1           1.    A method of linking information to video  
2   information comprising:  
3                linking video information with other information  
4   based on the location of the video information on a frame  
5   and a frame identifier; and  
6                accessing said other information in response to a  
7   user selection of a frame location.

1           2.    The method of claim 1 including defining a  
2   display grid system and specifying at least one location in  
3   said grid system using coordinates.

1           3.    The method of claim 2 including developing a  
2   frame identifier using a time code.

1           4.    The method of claim 1 including linking to other  
2   information without encoding a hyperlink into the video  
3   information.

1           5.    The method of claim 1 including linking to other  
2   information on the same medium that stores said video  
3   information.

1           6.    The method of claim 1 including linking video  
2   information on one processor-based system to other  
3   information on a separate processor-based system.

1           7.    The method of claim 1 wherein accessing said  
2   other information includes using a pointing device to  
3   select a location on a frame.

1           8.    The method of claim 7 wherein using a pointing  
2   device includes using a remote control unit.

1           9.    The method of claim 1 further including receiving  
2   a video stream, and pausing said video stream when  
3   accessing said other information.

1           10.   The method of claim 9 including automatically  
2   resuming the playback of said video stream when the other  
3   information is no longer being accessed.

1           11.   An article storing instructions that cause a  
2   processor-based system to:  
3               link video with other information based on the  
4   location of the video information on a frame and a frame  
5   identifier; and  
6               access said other information in response to user  
7   selection of a frame location.

1           12.   The article of claim 11 further storing  
2   instructions that cause a processor-based system to define

3 a grid system on each frame and specify at least one  
4 location in said frame using a coordinate system.

1 13. The article of claim 12 further storing  
2 instructions that cause a processor-based system to develop  
3 a frame identifier using a time code.

1 14. The article of claim 11 further storing  
2 instructions that cause a processor-based system to link to  
3 other information without an encoded hyperlink in the video  
4 information.

1 15. The article of claim 11 further storing  
2 instructions that cause a processor-based system to link to  
3 other information on the same medium that stores said video  
4 information.

1 16. The article of claim 11 further storing  
2 instructions that cause a processor-based system to link  
3 video information on one processor-based system to other  
4 information on a separate processor-based system.

1 17. The article of claim 11 further storing  
2 instructions that cause a processor-based system to receive  
3 signals from a pointing device to select a location on a  
4 frame.

1           18. The article of claim 11 further storing  
2 instructions that cause a processor-based system to receive  
3 a video stream, and pause the playback of the video stream  
4 when accessing the other information.

1           19. The article of claim 18 further storing  
2 instructions that cause a processor-based system to resume  
3 the playback of said video stream when the other  
4 information is no longer being accessed.

1           20. A processor-based system comprising:  
2                 a processor; and  
3                 a storage coupled to said processor, storing  
4 software to link to additional information based on the  
5 user's selection of a frame and frame location.

1           21. The system of claim 20 including a pointing  
2 device to enable the user to select a frame and frame  
3 location.

1           22. The system of claim 20 wherein said storage  
2 stores a coordinate system for identifying locations on a  
3 frame.

1           23. The system of claim 20 wherein the software  
2 identifies a frame using a time code.

1           24. The system of claim 20 wherein said software  
2 links to information stored outside said processor-based  
3 system.

1           25. The system of claim 20 wherein said software  
2 links to information stored on said system.

1           26. A method of recording incoming video information  
2 comprising:

3                 storing said video information as received, for  
4 playback in the sequence the information was received;

5                 allowing playback of any portion of stored video  
6 information while continuing to store said incoming video  
7 information; and

8                 automatically pausing the playback of said video  
9 information when the user changes the software focus, while  
10 continuing to record the incoming video stream.

1           27. The method of claim 26 including automatically  
2 pausing the playback of video information when the user  
3 selects a link to view different information.

1           28. The method of claim 27 including linking to  
2 different video information based on the user's selection  
3 of a location and a frame on a display of video  
4 information.

1           29. The method of claim 28 including automatically  
2 linking to said different video information based on the  
3 user's selection of a particular frame location using a  
4 pointing device.

1           30. The method of claim 26 including automatically  
2 resuming the playback of said video information when the  
3 user returns the focus back to the playback of said video  
4 information.

## LINKING TO VIDEO INFORMATION

### Abstract of the Disclosure

5 A system enables dynamic linking between a variety of  
video formats including television broadcasts, web pages,  
and video displays which are stored on magnetic or optical  
media. Each frame of the video information is identified  
together with a plurality of locations within that frame.  
The locations selected by the user for example using a  
pointing device is then used to access associated  
information either within the system itself or on an  
10 external system. Thus, in some embodiments of the present  
invention, any item on a given frame may be linked  
initially or thereafter to other information within or  
without the particular system containing that information.

DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below, next to my name.

I believe I am the original, first, and sole inventor (if only one name is listed below) or an original, first, and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

LINKING TO VIDEO INFORMATION

the specification of which

X	is attached hereto.
	was filed on _____ as
	United States Application Number _____
	or PCT International Application Number _____
	and was amended on _____
	(if applicable)

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claim(s), as amended by any amendment referred to above. I do not know and do not believe that the claimed invention was ever known or used in the United States of America before my invention thereof, or patented or described in any printed publication in any country before my invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, and that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve months (for a utility patent application) or six months (for a design patent application) prior to this application.

I acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, Section 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Section 119(a)-(d), of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

<u>Prior Foreign Application(s):</u>			<u>Priority Claimed</u>	
Number	(Country)	(Day/Month/Year Filed)	Yes	No
Number	(Country)	(Day/Month/Year Filed)	Yes	No
Number	(Country)	(Day/Month/Year Filed)	Yes	No

I hereby claim the benefit under title 35, United States Code, Section 119(e) of the United States provisional application(s) listed below:

_____	_____
(Application Number)	(Filing Date)
_____	_____
(Application Number)	(Filing Date)

I hereby claim the benefit under Title 35, United States Code, Section 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, Section 112, I acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal regulations, Section 1.56 which became available between the filing date of the prior application and the national or PCT International filing date of this application:

_____	_____	_____
(Application Number)	Filing Date	(Status-patented, pending, abandoned)
_____	_____	_____
(Application Number)	Filing Date	(Status-patented, pending, abandoned)

I hereby appoint Timothy N. Trop, Reg. No. 28,994; Fred G. Pruner, Jr., Reg. No. 40,779, Dan C. Hu, Reg. No. 40,025; Coe F. Miles, Reg. No. 38,559, and John R. Merkling, Reg. No. 31,716 my patent attorneys, of TROP, PRUNER, HU & MILES, P.C., with offices located at 8554 Katy Freeway, Ste. 100, Houston, TX 77024, telephone (713) 468-8880, and Joseph R. Bond, Reg. No. 36,458; Richard C. Calderwood, Reg. No. 35,468; Sean Fitzgerald, Reg. No. 32,027; David J. Kaplan, Reg. No. 41,105; Leo V. Novakoski, Reg. No. 37,198; Naomi Obinata, Reg. No. 39,320; Thomas C. Reynolds, Reg. No. 32,488; Steven P. Skabrat, Reg. No. 36,279; Howard A. Skaist, Reg. No. 36,008; Steven C. Stewart, Reg. No. 33,555; Raymond J. Werner, Reg. No. 34,752; and Charles K. Young, Reg. No. 39,425; my patent attorneys, of INTEL CORPORATION; with full power of substitution and revocation, to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith.

Send correspondence to Timothy N. Trop, TROP, PRUNER, HU & MILES, P.C., 8554 Katy Freeway, Ste. 100, Houston, TX 77024 and direct telephone calls to Timothy N. Trop, (713) 468-8880.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
